UPPER EAST SIDE CARDIOLOGY PLLC

Satjit Bhusri MD FACC

At Upper East Side Cardiology, we are embracing cutting-edge technology to enhance the integration of cardiac and pulmonary care. The introduction of the PulmOne MiniBox+ PFT machine into our clinic has been a game changer, significantly advancing our understanding of the complex interactions between heart and lung health. We have been using the MiniBox+ since 2020, and we are very satisfied with the performance and results it delivers.

The MiniBox+ features a user-friendly interface that allows our technicians to perform pulmonary function tests more efficiently, enabling them to spend more time with patients and less on navigating the technology. Its compact, portable design fits well in our urban clinic, helping us maintain a streamlined workflow without sacrificing space.

As a practicing physician, I regularly utilize DLCO and lung volume tests to assess the interconnected health of the heart and lungs. The DLCO test, which measures the efficiency of oxygen transfer from the lungs to the bloodstream, is particularly crucial for patients with conditions such as left-sided heart failure where pulmonary congestion may impair oxygen transfer. Assessing lung volumes is equally important, as it helps us gauge the impact of heart conditions on respiratory capacity. Such evaluations are vital for diagnosing and managing the nuanced interactions between cardiac and pulmonary functions, leading to more targeted and effective treatment plans.

Pulmonary function testing plays a critical role in assessing how effectively the lungs transfer oxygen into the bloodstream through DLCO testing, which is crucial for patients with heart conditions. This testing is invaluable as it helps determine whether reduced oxygen levels in patients are due to pulmonary issues or compromised heart function. Regular monitoring with DLCO provides essential data for fine-tuning treatment plans, ensuring optimal function of both heart and lungs.

The ability to perform immediate and precise pulmonary function evaluations is critical, especially for patients with combined heart and lung conditions. The portability and simplicity of the MiniBox+ ensure that these vital tests are accessible and minimally invasive, which enhances patient comfort and compliance. Using this advanced PFT technology, we provide cutting-edge, integrated care that not only improves diagnostic capabilities and treatment outcomes but also significantly enhances the quality of life for our patients.

Our holistic approach extends beyond treating current conditions to proactive monitoring and management of at-risk individuals. This comprehensive strategy substantially elevates our clinical efficacy and the quality of care we offer, profoundly impacting patient health and outcomes.
