July 26, 2024

We are a three-physician pulmonary practice in Northern New Jersey. Our focus for the last 30 years has been on treating patients with various forms of obstructive lung disease such as asthma and COPD. Our practice also includes evaluations for disability and Workers' Compensation issues related to traumatic events. These evaluations have required careful pulmonary function testing. We have regularly obtained diffusion capacity for carbon monoxide in such patients as well as evaluations of total lung capacity and flow rates. We test anywhere between three to five patients per day, on a regular basis.

We have been using the PulmOne MiniBox+ for the last three years, and the results of pulmonary function studies in our patients when compared to hospital based traditional pulmonary function testing were found to be equal or superior.

Our technicians have been impressed by the reliability of the data and the ease in which these tests can be performed. As in all medical equipment, technical issues arise, and in this case, they have been rapidly and efficiently corrected.

Overall, we have been extremely impressed with the PulmOne MiniBox+ and find that it has surpassed testing with our previous equipment, mainly a body box, due to its ease of use and accessibility for some of our elderly and wheelchair-bound patients.

We have been pleased with our PulmOne MiniBox+ and without question have been impressed by the results, the ease of function and the response of the service team. I would highly recommend it to any independent pulmonary practice.

Respectfully yours,

Benjamin H. Safirstein, M.D., F.A.C.P., F.C.C.P.
