I am the founder and lead physician of *The Center for Allergy, Asthma & Immunology* in New york, where I have a dedicated team of six medical doctors and nine nurse practitioners. My priority has always been to provide the highest level of care to both children and adults with allergies, asthma, and immunologic conditions. Finding the right tools to deliver that care has been crucial, and one that has truly transformed our practice is the MiniBox by PulmOne.

Since 2016 we've integrated six MiniBox devices across our six clinic locations. Over the past eight years these have become our go-to for pulmonary function testing, particularly for our pediatric. patients.

Testing respiratory conditions in children can be challenging, as they often feel anxious or scared.'" Cre ting a calming environment is key to getting accurate results. The MiniBox's child-friendly, non-intimidating design has made a world of difference. We are now able to conduct precise PFTs on children as young as 5 years old or weighing as little as 44 pounds. While this used to be difficult with traditional equipment, it is now much smoother with the MtniBox, which helps put children at ease, making the experience less stressful for both the kids and their parents.

PulmOne's clinical advisors have also been incredibly supportive. They provide thorough training for our pulmonary function testing technicians and continually offer guidance as needed. This commitment to education ensures that our team is always confident and knowledgeable in using the MiniBox, which directly benefits our patients.

The MiniBox has been an incredible asset to our practice, making pulmonary testing more efficient, less stressful, and more accurate, leading to better outcomes for our patients. I'm proud to have this technology as part of our practice, and I look forward to continuing to use it to maximize the level of care we offer.
