David Rigby, BSc, MCMI fCMgr
Principal Physiologist
Spire Cheshire Hospital
Fir Tree Cl, Warrington WA4 4LU, UK

With 24 years of professional experience and currently Principal Physiologist at Spire Cheshire Hospital, I have come across various pulmonary testing devices during my career. I would like to share my positive experience particularly with the MiniBox+ lung function testing device.

The MiniBox+ has proven to be a game-changer in terms of patient comfort. Patients are notably more compliant during testing than with the body box. Since there's no cabin, it's especially beneficial for bariatric patients and those suffering from claustrophobia. In addition, only 60 seconds of normal tidal breathing is needed for lung function testing; there are no panting maneuvers involved.

From a professional standpoint, the MiniBox+ allows for quicker testing compared to plethysmography while maintaining comparable results. Additionally, its portability and user-friendly design make it an excellent choice for everyday use.

The device's setup is straightforward, and its software is intuitive, allowing for easy configuration and calibration. Reports are automatically generated. Troubleshooting has also been a smooth process, and the teaching material is readily accessible, further enhancing its ease of use.

I highly recommend the MiniBox+ to respiratory clinics looking to improve and expand their pulmonary diagnostic services.
